

William Brownson

- Trying new languages can be fun and frustrating at the same time
- Double when it's a different type of language
- The first thing to do when making such a dramatic leap, is to read A LOT first, unlike I did. Start off with reading, then jump into the code
- In Prolog there is no concept of time, so this makes you have to think of coding in an entirely different way.
- Prolog has some very practical uses, especially when combined with other code such as C.
- Gauging time for a project is something one should carefully plan out, because if you miss a timeslot, it messes up everything down the line.
- Remember that when starting a project, nothing is set in stone, be flexible and change your roadmap as you discover new things.
